

I am concerned that long cables, such as power lines, may act as transmission points for low frequency signals, adding yet an additional level of noise to otherwise congested signals.

In my review of the technology proposed, as well as the counter options, I would ask that you leave the power utilities out of the data communications business, and the phone companies out of the power distribution business.

We have so many problems with the national power grid, and it's stability. Are the power companies going to now try to add data to this grid, and expect the tax payers to foot the bill for the upgrade so they can sell more products? This also doesn't seem right.
